

# Save this planet?

We need to create a **global cooling** or eventually face a social and ecological *collapse because of global warming*.

## The Solutions.

**Zero Emission Energy** - power our grid with 100% renewable energy using wind, solar PV, and solar thermal with heat storage (24hr solar power).

**Zero Emission Transport** - A massive build of new walking, cycling, and electrified rail infrastructure including light rail and super fast rail. Cars would be largely electric with hybrids in remote areas using sustainable biofuels.

**Negative Emission Agriculture and Forestry**  
Careful use of fertilisers, ceasing land clearing and native forest logging, eating less beef, lamb, dairy and rice, re-vegetation, building soil carbon and using biochar.

**Building a Sustainable Economy** - A new economy which focuses on service and knowledge growth rather than material and population growth.

### Dealing with corrupt politics

Diversifying media ownership and limiting large donations, while improving democratic processes and representation.
